Re: Draft Interim Response Steps Work Plan/Additional Information
Olin Chemical Superfund Site, 51 Eames Street, Wilmington
Massachusetts

This is my second comment regarding the above:

"Bloody Bluff's Fault" should be mentioned as it runs through the site towards the west (public water supplies). This is important for EPA/Consultants to know when considering further actions at the site. I understand that it runs right through the middle of the site with the highest concentrations (i.e. DAPL-proposed sale to NET for a transrail solid waste & transfer operation without the usual local/state regulations to protect public health). This is an outrage and the "fault" must be considered in further investigations at least in clean-up actions.

Will "Bloody Bluff's Fault" be included in both the clean-up actions and later down the line when we have a complete understanding of the site; and will this stop any current proposals for re-use at this point in time when our community is so "at risk" from this site.

We have lost much; and only doing "the right thing" will help our community, industries, and all those who are stakeholders and at risk.

Sincerely,
Deborah L. Duggan
